These two quotes tell you the reasons **why** you should know what happened in the past. By studying history, you can avoid the mistakes made in the past. By studying both the failures and successes of the past, you can plan for future success.

There is another reason to study history—history is an adventure story. History is full of daring deeds, good luck and bad, heroes, cowards, and spies. The history of a country or an organization is like the biography of a person. A biography is the story of a person’s life. Naval history is the story of the life of the Navy. Since this chapter is the biography of the life of the United States Navy, the logical place to start is with the birth of the Navy.

**THE BIRTHDAY OF THE UNITED STATES NAVY**

**Learning Objectives:** When you finish this chapter, you will be able to—

- Identify the important events of naval history.
- Recognize the importance of naval actions and traditions

In school, you learned about the birthday of the United States. You were told about the events that happened on July 4, 1776. The United States Navy had its birth on October 13, 1775. How could this be? How could the Navy be older than the United States?

Just as there wasn’t a United States of America on July 4, 1776, there wasn’t a United States Navy on October 13, 1775. But, what led to the formation of the United States Navy happened on October 13, 1775.

Remember when the Second Continental Congress met on May 10, 1775, the colonists were already fighting the British. Before long, it was clear that if the Colonies were to survive, a Navy was necessary. Therefore, on October 13, 1775, the Second Continental Congress authorized the purchase of two vessels; the United States Navy was born.

**THE CONTINENTAL NAVY**

**Learning Objective:** When you finish this chapter, you will be able to—

- Identify the ships of the Continental Navy to include the importance of their actions.

Navies are created from the spirit of independence and under the threat of war. They become mature by defending their country. This is the way it was with the first American Navy.

The American Colonies depended on the sea for their livelihood. All along the coast, harbors and shipbuilding docks offered work to many and provided income to thousands more. When the conflict between the Americans and the British began, these were the first ports the British attacked. These were also the ports from which the Continental Congress and the States sought to send out ships of a tiny and hastily organized naval force to harass the mightiest sea power in the world and its merchant fleet. This tiny naval force sought to capture enemy supply and munitions vessels.

What was life like in that first Navy? Where did its ships and men come from? How was it organized? And, importantly, what role did it play in building the proud tradition of the United States Navy today?

Like its beginnings, the Navy of the American Revolution was fragmented into many parts, each acting independently of the others. For instance, several naval engagements between the Americans and the British actually occurred before the Continental Congress authorized a Navy. Though the American Navy officially began in October 1775, some time passed before the new Navy had any effect on the mighty British Navy.
SHIPS OF THE CONTINENTAL NAVY

What constituted a warship in the late 1700s? During the revolutionary war and into the 19th century, naval vessels were grouped into three major classes—

1. Ships-of-the-line. These were the battleships of the sailing days. These ships were the largest of all sailing warships and carried 64 to over 100 guns of various sizes. However, our Navy’s ships-of-the-line didn’t come into existence until years later, long after the Revolutionary War was over.

2. Frigates. These were the cruisers of the 18th century. These cruisers were next in size, usually smaller and faster than average ship-of-the-line. They generally carried 28 to 44 guns.

3. Sloops-of-war. These were the small sailing warships. They carried 10 to 20 guns.

Another group of naval vessels were the privateers. Privateers were commissioned by the Continental Congress and by individual states to capture enemy merchant ships as prizes of war.

Typical of the independent “fleet” of privateers was the schooner. The schooner was a small, fast, flexible, flush-deck ship that carried smooth-bore cannon. With small ships like these schooners, the colonists broke the British stranglehold on main New England harbors by slipping past the Royal Navy’s men-of-war and hiding in inlets. Unable to meet the British head-on, the American ships outmaneuvered them and jabbed here and there instead of standing full force and slugging it out.

Navy ships in the Continental Navy included the Providence, a 12-gun sloop; the Lexington, a 16-gun brig (converted from a merchantman); and the Bonhomme Richard, a loan from the French, an old East Indiaman. Later in this chapter, you will find out how other ships bearing some of these names made history in their own right.

THE FIRST UNITED STATES SUBMARINE

A young American experimented with a subsurface craft he hoped would help drive the British out of New York harbor and away from American shores for good. David Bushnell was a Yale medical student who had been working on a small submarine for some 4 years and finally completed it in 1775.

This first warfare submarine, named the Turtle, was described by Bushnell as having “some resemblance to two upper tortoise shells of equal size, joined together…” It was 7.5 feet deep, and under ideal conditions had a maximum speed of 3 knots. A single operator could stay down for 30 minutes.

The Turtle was armed with an oak casing filled with 150 pounds of explosives. This charge could be attached to the bottom of an enemy ship where it was intended to remain until detonated by a simple clockwork mechanism.

After completing the submarine, Bushnell took it for several dives to prove its seaworthiness. Finally, in September 1776, he was ready to try it against the British in New York harbor. Sergeant Ezra Lee, a volunteer from the Connecticut militia, maneuvered the Turtle through the use of hand-driven screw propellers. His mission was to attach a time-fuse charge of gunpowder to the hull of HMS Eagle. However, the mission was aborted when the auger failed to penetrate the copper sheathing of the Eagle.

Bushnell made a few more attempts to use the Turtle against the British in the Delaware River. He attached mines to the Turtle and floated the mines against ships. These attempts failed. The submarine was finally sunk by the British in New York harbor—the first recorded instance of an antisubmarine attack.

CONTINENTAL NAVY ACTIONS

The new Navy ordered to be established by the Continental Congress came into being in the last months of 1775. To build a fleet, Congress authorized the construction of 13 new frigates (ranging from 24 to 32 guns) and the conversion of 6 merchant ships (ranging from 10 to 24 guns). These merchant ships included the USS Hornet and the USS Alfred. The USS Alfred had the distinction of being the U.S. Navy’s first flagship and is said to be the first U.S. naval vessel on which the “Flag of Freedom” was hoisted (by John Paul Jones). All were solidly constructed ships with a number of guns. Even so, they were at a serious disadvantage because they were pitted against the established and superior British force—then the finest Navy in the world.

---

Student Notes:
NOTE

As you read along, check the maps at the back of the chapter.

The first commander in chief, Esek Hopkins, put the first squadron of the Continental Navy to sea in February 1776. Under the guns of the USS *Providence* and the USS *Wasp* and with the squadron headed by the USS *Alfred*, over 200 Sailors and Marines landed on New Providence Island in the Bahamas. John Paul Jones served as first lieutenant aboard the USS *Alfred*.

Hopkins' raid on New Providence Island was the first amphibious operation carried out by the American Navy and Marines. The squadron captured a number of cannons and supplies from the fort.

Because the British blockaded the American coast, it was difficult for the newly outfitted ships to reach the sea. The USS *Montgomery* and the USS *Congress*, ships of 28 and 24 guns, were built at Poughkeepsie, NY on the Hudson River. When the British occupied the port of New York, these ships were bottled up. To prevent their capture by the enemy, the U.S. government had to destroy them. Two more ships built in Philadelphia suffered a similar fate. Some of the others were also blockaded in their home ports, and one ship, the USS *Trumbull*, was bottled up for 3 years because it couldn’t clear the sandbar in the Connecticut River.

The new frigates of the Continental Navy had their moments. The USS *Hancock* and the USS *Boston*, both built in Massachusetts, set out together in mid-1777. They captured two British brigs and were then involved in separate actions with the British warships *Somerset* and *Fox*. After escaping from the *Somerset* on May 30, 1777, they met the *Fox* a week later and successfully captured it. Later, the two Continental ships were pursued by the powerful HMS *Rainbow*. Following a 39-hour pursuit, the *Rainbow* bore down on the USS *Hancock* and captured it. The USS *Boston* escaped and continued to serve in various actions over a period of some 3 years. Its last action was in the defense of the Charleston, South Carolina, harbor where it was captured by the British in May 1780.

After its capture by the British, the *Hancock* went on to serve in the Revolution, but on the enemy’s side. By a twist of fate, it was the *Hancock* (renamed the *Iris*) that captured a sister frigate, the USS *Trumbull*, one of the original 13 frigates built for the Continental Navy. (The British crew was said to have called the American built ship one of the finest frigates in which it had sailed.)

Among the names associated with this new made-in-America fleet of frigates are John Barry, who courageously commanded many ships; John Manley, who captured the *Nancy* while in Washington’s Navy; and Abraham Whipple.

The skipper of the USS *Providence*, Whipple, was a member of a three-ship force that found itself on the edge of a huge, heavily guarded, enemy convoy off Newfoundland during a fog. Sending armed boarding parties to the merchant ships, the Americans managed to take 11 ships as prizes without being detected by the ships protecting the convoy. Cargoes and captured ships worth a million dollars were dispatched back to the States.

**John Paul Jones**

Among the most daring commanders bringing the war to British waters was John Paul Jones (fig. 5-1). As skipper of the USS *Ranger*, he left France on April 10, 1778, for raids against the British. After capturing a number of ships, he actually landed on British soil, raiding Whitehaven, England.

![John Paul Jones](image)

**Figure 5-1.—John Paul Jones, father of our highest naval traditions, represents the seaman, leader, officer, and gentleman at their best.**

*Student Notes:*
The tiny new Navy played a significant role in the first official recognition by a foreign nation of the American “Stars and Stripes” flag. On February 14, 1778, John Paul Jones sailed into Quiberon Bay, France, in the USS Ranger and saluted the French fleet anchored there. A nine-gun salute was given in return. A gun salute given to a revolutionary government was a signal of that country’s recognition. France became one of the first foreign powers to recognize the struggling government of the American Colonies. (In 1776, the Dutch had given recognition to an American flag [not the Stars and Stripes] at St. Eustatius, an island in the West Indies belonging to Holland.)

In 1779, John Paul Jones took command of an old, decaying French merchant ship that he renamed the USS Bonhomme Richard, honoring Benjamin Franklin. It carried 42 relatively light guns (some in doubtful condition). Jones headed for the coast of Ireland, capturing some ships and destroying others. On September 23, 1779, Jones met the British warship Serapis (with 50 guns), and a furious battle ensued near the headland of Flamborough Head. As Jones wrote later:

> Every method was practiced on both sides to gain an advantage, and rake each other; and I must confess that the enemy's ship, being more manageable than the Bonhomme Richard, gained thereby several times an advantageous situation, in spite of my best endeavors to prevent it.

The two ships, lashed together with grappling hooks so neither could escape, pounded away at one another. The USS Bonhomme Richard began taking the worst of the beating. The ship began to fill with water and fire broke out in several places. According to one story, a gunner in a state of panic was about to strike the colors when Jones hurled his pistol at him, striking him down. The battle continued and the fighting was furious. The outcome was uncertain until the end. The highlight of the battle came when, after being asked if he had struck colors, Jones replied, Struck, sir? I have not yet begun to fight! These words inspire Sailors to this day.

What turned the tide of victory for Jones? It was his forces aloft. Armed with muskets and climbing along the interlaced rigging of the two ships, Jones’s men kept the deck of the Serapis clear by shooting and dropping chains and other material down on the enemy. A member of Jones’ crew climbed to the Serapis’ maintop and managed to drop a hand grenade on to the gundeck, which ignited the gunpowder and scattered cartridges. In that man-to-man sea battle, the British were finally forced to surrender. The battle of the USS Bonhomme Richard versus the Serapis went down as one of the great naval battles in history.

By the time the war was over, the official Continental Navy operated some 56 vessels at one time or another. However, it only managed to reach a peak of 27 ships, averaging 20 guns, that operated at the same time. This tiny Continental Navy, hurriedly assembled when the Colonies declared their independence, served not only to inflict damage on the proud ships of the Royal Navy but also to lift American morale with each of its victories. John Paul Jones, Gustavus Conyngham, and Lambert Wickes were among those who brought the battle to the British on their own waters. The news of daring raids and victorious battles at sea was acclaimed in the 13 youthful Colonies of the United States.

Privateers

American privateers harassed British shipping over lengthy sea-lanes. At first, ships of all types were converted for harassment purposes. Later, ships were specially built to do this job. These ships were fast and reasonably well armed. Men from all walks of life signed up to serve on these ships. Private financing to arm and fit the vessels was needed, but that was rarely a problem because a share in a privateer could mean a fortune almost overnight.

The British Navy began a system of convoys to protect its merchant shipping, but it was far from foolproof. The moment a merchantman dropped behind, it was in immediate danger because a warship couldn’t leave the convoy to protect just one ship. Then, too, convoys could protect only so many ships.

It’s estimated that Congress issued more than 1,600 commissions for privateers during the Revolutionary War. The privateers operated not only along the American coastlines, but also far out into the Atlantic and even into the English Channel and the Irish Sea.

According to one reasonable estimate, the British were said to have lost some 2,000 merchant ships, manned by crews totaling 16,000, to the American privateers. The merchant ships captured as prizes were manned by prize crews from the privateers and sailed to a friendly port where the ships and cargo were sold.
At the end of the Revolutionary War, a new federal government was established. In 1783, the Navy was down to five ships. The Navy was disbanded, and the last frigate, the USS *Alliance*, was sold in 1785.

Soon, Congress saw the need for a Navy. America’s small merchant fleet was being molested on the high seas. In 1794, a Navy-conscious Congress authorized the construction of six frigates. They were to be of a new design—long and strong. These ships had a combination of firepower and class. One of these was the USS *Constitution* (fig. 5-2), which was completed in 1798. This ship was equipped with 44 guns, could sail at 13 1/2 knots, was 175 feet long (at its gundeck), and had a tonnage rating of 1,576 tons. Its mainmast towered 105 1/2 feet above its decks.

Figure 5-2.—The new and radical USS *Constitution*, built for speed and firepower, helped to rid the Mediterranean of the Barbary pirates.

NOTE

The USS *Constitution* is still in commission and can be seen at the Boston Navy Yard.

The USS *Constitution* fulfilled the thoughts and dreams of President John Adams, who did so much to form the U.S. Navy. John Adams established the Navy Department in 1798.

THE EARLY YEARS

Between America’s first two wars with Great Britain (the Revolutionary War and the War of 1812), the early U.S. Navy was involved in two other conflicts—the Quasi War and the Barbary States War.
Quasi War

The “Quasi War” with France, 1798 - 1801, was entirely a naval war. It followed worsening diplomatic relations with France, including a refusal by the French Secretary of Foreign Affairs to receive U.S. representatives unless a bribe was paid and a loan granted. The famous expression “Millions for defense, but not one cent for tribute” originated at this time. The Quasi War was the baptism of fire for the United States Navy under the new Constitution.

Barbary States War

The U.S. Navy was sent to the Mediterranean to deal with the Barbary States, who were forcing other nations to pay ransom for safe passage through the Mediterranean Sea. During the campaign, Lieutenant Stephen Decatur and 84 seamen slipped into the harbor at Tripoli on February 16, 1804, and burned the captured frigate USS Philadelphia (fig. 5-3). Not a single American Sailor was lost. Britain’s Admiral Lord Nelson described the raid as “one of the most bold and daring acts of the age.”

On August 19, 1812, Captain Isaac Hull aboard the USS Constitution defeated the British frigate Guerriere (fig. 5-4), and the USS Constitution earned its nickname “Old Ironsides.” The victory convinced Congress and President Madison that a stronger Navy was needed to win the war and protect the country.

THE WAR OF 1812

The War of 1812 was brought on, in part, because the British were impressing (forcing Americans to serve in the British Navy) American seamen. England impressed American seamen to make its presence felt and demonstrate its power on the American continent.

Following the War of 1812, our Navy underwent technological changes. Before the Civil War, new scientific advances foreshadowed the incredible technological revolution that continues into today’s world.

One change was the use of steam. The Navy entered a new era, an era of the “steam-driven warship.” Harnessing the power of steam was the most important development in the surface Navy during the first half of the 19th century. Steam began to replace wind as a means of propulsion. It promised to eliminate some of the hazards and delays caused by ships being blown off course or left dead in the water.

Student Notes:

Figure 5-3.—Lieutenant Stephen Decatur and 84 seamen slipped into Tripoli harbor and burned the captured American frigate USS Philadelphia.

Figure 5-4.—During the War of 1812, Captain Isaac Hull, aboard the USS Constitution, defeated the British frigate Guerriere.
The principles of steam power were known for centuries. But, it was Robert Fulton who successfully used steam to power a commercial steamboat. After making a number of important modifications to James Watt’s basic steam engine, Fulton sailed his riverboat Clermont up the Hudson River in 1807. Fulton helped build USS Demologos, the Navy’s first warship to use steam. It was originally intended to defend the port of New York during the War of 1812. The USS Demologos was rechristened the USS Fulton in Robert Fulton’s honor.

1815 TO THE CIVIL WAR

From 1815 to 1840, the Navy continued to expand its sailing fleet. In fact, more than 74 ships-of-the-line were built. In 1837 the Navy launched the 3,104-ton USS Pennsylvania, the largest of America’s ships-of-the-line.

In 1841, the Navy launched the USS Missouri and the USS Mississippi. These were our first ocean-going, steam-driven capital ships. At the same time the US Navy was building bigger ships, it was developing steam powered ships and iron clad ships.

At the same time it was harnessing steam power for ship propulsion, the Navy was making advances in ship construction. The Navy began making its ships with iron instead of wooden hulls. In 1843, the Navy launched its first iron-hulled warship—the paddle sloop USS Michigan. This side-wheeler was 163 feet long and displaced 685 tons. It was powered by a 170-horsepower, two-cylinder, steam engine. Without using its sails, the USS Michigan was capable of making 8 knots.

Through the efforts of farseeing men like Commander Matthew Calbraith Perry, USN, the Navy was becoming more steam conscious. Perry is referred to as the “Father of the Steam Navy.” He was enthusiastic about the possibilities of steam, and was in charge of construction and in command of the Navy’s second steam frigate the USS Fulton. The harnessing of steam power was considered the most important naval development since the cannon.

The newly built steamships posed problems if engaged in battle. Their paddle wheels and steam engines could be easily damaged by enemy fire. This problem was fixed by changing the design of the ships so that the paddle-wheel housing was enclosed behind 5-foot-thick walls and set in an inboard channelway.

Steamship development overcame problems one by one. For example—

• Stronger engines were developed;
• Screw propellers replaced the paddle wheel; and
• Coal as a fuel was recognized as more efficient than wood.

These changes didn’t happen overnight; they required long periods of trial and error. But in the 1840s, new ideas were being explored by their proponents. On September 5, 1843, the Navy’s first successful steamship, the USS Princeton, was launched. Its new type of propeller eliminated the vulnerable paddle wheels and permitted the ship’s engines to be placed below decks in protected spaces.

Other actions between 1815 and the Civil War included the following:

• The Navy took the first steps in Antarctic exploration. Notably, Lieutenant Charles Wilkes visited the subpolar region in January 1840 and proved conclusively that the icy land was, in fact, a continent.

• Following Texas’ admission to the U.S. as the 28th state, Mexican troops crossed the Rio Grande. War broke out. The Mexican-American War was primarily a land war. However, the Navy did get involved. It blockaded port cities in the Gulf and provided protective action by the “Mosquito Fleet” during the first large-scale amphibious operation in U.S. military history—the landing of some 10,000 U.S. troops at Vera Cruz. (The Navy itself was not equipped to carry out such an operation at that time.) Marines were also involved in this war—they marched with Scott to Mexico City, coining the phrase “…from the halls of Montezuma…” in the famed Marines’ song.

• The Navy was involved in diplomatic relations. Commodore Matthew C. Perry signed a treaty with Japan on March 31, 1854. This was the treaty that opened Japan’s ports to American trade and provisioning of ships. England and Russia soon followed with their own treaties, all modeled after Perry’s.
REVIEW 2 QUESTIONS

Q1. After the Revolutionary War, what was the next significant role of the U.S. Navy?

Q2. List the two conflicts that the American Navy was involved in between the Revolutionary War and the War of 1812.
   a.
   b.

Q3. Describe the event during the Barbary States War that Lord Nelson thought of as one of the most bold and daring acts of the age.

Q4. List two events that the U.S. Navy was involved in during the War of 1812
   a.
   b.

Q5. The Mexican-American War was primarily a land war. However, the Navy provided what service during this war?

THE U.S. NAVY FROM THE CIVIL WAR TO THE 20TH CENTURY

Learning Objective: When you finish this chapter, you will be able to—

• Recognize the roles and responsibilities of the Navy from the Civil War to the 20th century to include the Civil War and the Spanish-American War.

Student Notes:
A young Confederate lieutenant, George Dixon, was convinced that the boat could be useful to the South. The CSS Hunley was moored off Charleston’s Sullivan Island, just a few hundred yards from the USS Housatonic. In the first true submarine attack in naval history, Dixon cast off toward the large warship. The CSS Hunley attacked the USS Housatonic in calm waters in the dark of night. The submarine was sighted by lookouts on the USS Housatonic; however, it didn’t have the time or the opportunity to strike back or set sail.

The CSS Hunley hit the USS Housatonic driving its shaft deep into the ship’s hull. The heavy charge of gunpowder the submergible was carrying went off prematurely, and the CSS Hunley never had a chance to escape. It and all of its crew went down. The USS Housatonic had the same fate. It was hit on the starboard side and went down in just 4 minutes. Another northern vessel moved to its rescue, and only a few of its seamen were lost. Even though he lost his life, Lieutenant Dixon had demonstrated that submarines could be useful weapons of war.

**Other Innovations**

Some people associated with the Navy during the 19th century were interested in the air above the ocean. The USS George Washington Parke Custis of the Civil War days might be labeled as the Navy’s first “aircraft carrier.” Actually, it was a balloon boat used to launch observation balloons over enemy installations. It was 122 feet long, and its total cost was $150.

**Other Civil War Actions**

**Capture of Vicksburg.** On the Mississippi River, the capture of Vicksburg, Mississippi, by the combined naval forces of Rear Admiral David G. Farragut, Acting Rear Admiral David D. Porter, and the commander of the Army in the West, General Ulysses S. Grant gave the North control of the entire river. The capture of Vicksburg cut off important Confederate supplies of food and clothing coming from Louisiana, Texas, and Arkansas.

**Battle of Mobile Bay.** On August 5, 1864, David Farragut, the Navy’s first admiral, gave his famous order “Damn the torpedoes! Full speed ahead!” (Torpedo was the name used at the time for mines.) Farragut’s order won the Battle of Mobile Bay (fig. 5-5). This victory closed the South’s most important port (since New Orleans had already fallen) and tightened the Union blockade.

**Student Notes:**

The Civil War produced many men whose names are still famous in the Navy:

- Andrew Foote, whose gunboats helped General Grant capture the Mississippi River fortresses
- John Dahlgren, the father of modern naval ordnance (fig. 5-6)
• David D. Porter (son of the captain of the *Essex*), who commanded the mortar flotilla in the capture of New Orleans

**POST CIVIL WAR NAVY**

Alfred T. Mahan (fig. 5-7) was one of the first instructors at the Naval War College, and he influenced naval strategy. In 1890, the first of his many books and articles on sea power was published. One of his books (*The Influence of Sea Power Upon History, 1660 - 1783*) stressed that without control of the seas, a nation at war could not expect victory. He defined sea power; showed the importance of understanding naval needs; and advocated a large, powerful Navy capable of assembling an overwhelming force to defeat the enemy’s Navy. His books on sea power became the “bible” of many navies, and for many years, they influenced the thinking of naval strategists. Part of our Navy’s readiness for the war with Spain was a result of the influence of his works.

![Figure 5-7. A philosopher of naval strategy, Mahan researched military history and proved that the nation controlling the oceans is the nation that maintains its supremacy in war or peace.](image)

**Surface Ships**

Steam power was the major development in ship propulsion during the first half of the 19th century. Iron construction of ships was the outstanding development of the second half. The two developments went hand in hand—all the navies of the world recognized the advantages of steam power, and iron warships needed large steam engines to power them. The engines, in turn, called for bigger ships to accommodate them.

Shipbuilders used iron first as framing and then as a material for the entire ship. Iron was first used as framing to reinforce ships so that they could be used to ram their opponents as well as fire on them. It was several years before an economical way to process iron strong enough for the entire construction could be found. (Wooden ships had the advantage of being cheaper to build than iron ships.)

After the Civil War, the Navy began a drawdown period. A year and a half after the war, the total number of Navy ships was 236, with only 56 in active service.

World conditions made our Country aware that the Navy was small. Therefore, in 1882 and 1883, Congress authorized the construction of the “protected cruisers” USS *Atlanta*, USS *Boston*, and USS *Chicago* and the dispatch boat USS *Dolphin*, which had both masts for sails and stacks for smoke. They were steel hulled and signaled the end of the ironclads introduced only 40 years earlier. These new cruisers were in the 13- to 14-knot class. They sported new guns, new types of turrets, and armor.

Once more, the Navy began to rebuild its strength. Continued changes were made as the new steel Navy took on new shapes. Still clinging to the past, the USS *Newark*, a 4,098-ton protected cruiser, was the last of the Navy’s warships to be fitted with sails. It was launched in 1890 and commissioned the following year. Because of its many improvements, the USS *Newark* has been labeled as the first modern cruiser in the U.S. Fleet.

With the development of the self-propelled torpedo, long-range torpedo boats made their debut. In 1890, one of the first torpedo boats joined the fleet—the 22.5-knot USS *Cushing*. The Navy acquired 16 fast torpedo boats and three 185-ton boats capable of speeds of 27 knots.

The development of torpedo boats caused the shape of ships to change. An example was the USS *Truxtun*, which led to the design of our present-day destroyers. These ships were designed to combat torpedo boats. Later improvements resulted in destroyers themselves carrying torpedoes.

**Subsurface Ships**

Since surface ships were driven by steam, why not submarines? Steam requires air, fire, and heat, and those were in limited supply aboard a submarine. During the 19th century, the internal combustion engine was developed. Use of this engine on ships had drawbacks.
However, many of its problems were overcome by two inventors—John Holland and Simon Lake. Holland and Lake had opposite theories about the submarine.

- Holland thought submersion should be made by power-diving, using the force of the propeller and the angle of the bow planes.

- Lake said boats should descend on an even keel with slight negative buoyancy.

Lake was more interested in underwater exploration than naval warfare. He thought a submarine could be equipped with wheels and driven along the ocean’s floor, although he did not pursue that idea. Holland was more practical; his design included a workable torpedo tube, which Lake’s did not.

Holland received a $150,000 contract from the Navy for a subsurface vessel. His first attempt failed, but the Navy was impressed enough to award him another contract. By 1898, he had built USS Holland, a cigar-shaped craft, 52 feet long and 10 feet in diameter. The USS Holland was equipped with a gasoline engine for surface power and generators that charged batteries for underwater power. It was armed with a torpedo tube that fired an 18-inch torpedo and a bow gun recessed into the hull. A New York newspaper commented that “...the offensive powers of the Holland are, considering the size and method of attack, far greater than any other engine of war.”

The submarine’s problem of running blind when submerged was corrected after Simon Lake experimented with a set of prisms and lenses. Before that, the USS Holland had to surface to permit the crew to look out the conning tower; causing it to lose its greatest advantage—surprise. Lake and a professor from Johns Hopkins University worked out a design for the periscope. The periscope, with various improvements, remained the submarine’s basic visual aid until 1958.

THE SPANISH-AMERICAN WAR

At the end of the 19th century, the United States and Spain became involved in diplomatic disputes about Cuban independence, trade, and U.S. citizens living there. On the evening of February 15, 1898, a terrific explosion suddenly tore through the battleship USS Maine at anchor in Cuba’s Havana harbor. The explosion killed 250 American Sailors. The explosion was a major reason for the start of the Spanish-American War...Remember the Maine became our battle cry.

One event stood out in this short war—Commodore George Dewey’s seizure of Manila Bay in the Philippines. On May 1, 1898, he steamed into Manila Bay and ordered, “You may fire when you are ready, Gridley.” Dewey’s resounding victory destroyed Spain’s naval power in the East and was instrumental in quickly ending the war.

Shortly after the Battle of Manila Bay (fig. 5-8), U.S. naval forces at Cuba cornered the Spanish Atlantic Squadron at Santiago Bay. On the morning of July 3, 1898, the Spanish squadron tried to break out of the bay and was completely destroyed. Cuba and Puerto Rico fell shortly afterwards, effectively ending the war.

![Image of the Battle of Manila Bay](image_url)

**Student Notes:**
THE NAVY FROM 1900 THROUGH WORLD WAR I

Learning Objective: When you finish this chapter, you will be able to—

- Recognize the roles and responsibilities of the Navy during World War I.

The 20th century began with a world at uneasy peace. Between the end of the 19th century and WWI, the U.S. Navy developed some new weapons. For example, in April 1900 the Navy accepted its first operational submarine, USS Holland.

SUBMARINES

The Navy continued to experiment with the development of submarines throughout the next decade. One of the main problems continued to be the gasoline engine—it heated up and gave off fumes that overcame many of the crew.

The gasoline engine was replaced by the diesel engine. The first diesel engines were installed in the USS Skipjack (SS 24) and the USS Sturgeon (SS 25). These new engines required no complicated ignition or sparking systems, produced fewer fumes, and were cheaper to operate. The diesel engine and electric battery remained as the main propulsion systems for submarines until nuclear power emerged in the 1950s.

DESTROYERS

Destroyers had been used primarily to deliver torpedo attacks. With the development of the submarine, they became submarine hunters. Construction of our first destroyer, which displaced 420 tons, began in 1899. Destroyers proved so successful that building these ships began on a large scale. From 1892 to 1914, the start of World War I, over 50 destroyers were built; and 273 were ordered during the war.

CRUISERS AND BATTLESHIPS

The battleship resulted from the major changes in ship design that took place during the 19th century. Battleships carried heavy guns and corresponding armor protection. The United States had begun building its battlewagons in the late 1880s; each succeeding class had more firepower than the one before.

Student Notes:
By 1895, the heavy elements of the U.S. Fleet consisted of 15 steel cruisers, the heavy cruiser USS New York, and three battleships. The first two battleships were the USS Texas, commissioned on August 15, 1895, and the USS Maine, commissioned on September 17, 1895. Both were listed as “second-class” battleships. The third ship, the USS Indiana (BB 1), was commissioned in 1895. It was our first “first-class” battleship.

In 1906, the United States began a large battleship-building program. Five battleships were of the same class as the USS New Mexico and USS Colorado; however, they weren’t completed until after World War I. Based on lessons learned from wartime experiences, many improvements were incorporated into their design. For example, battleships of the same class as the USS Colorado were the first ones equipped with 16-inch guns.

NAVAL AVIATION

As the 19th century drew to a close, the Wright brothers were working on their flying craft. The Wright brothers’ first flights at Kitty Hawk, North Carolina, began the vision of the future. Most people thought of flying as a stunt or a sport, while others talked about crossing the ocean by airplane. One European wrote in part,

...flights over the ocean will be made possible by a new type of ship...[its] deck will be clear of all obstacles, flat and wide as possible...[it will] have the aspect of a landing field...its speed shall equal that of a cruiser...housing of planes will be arranged below deck and planes will have folding wings...and to one side there will be the service personnel workshop.

Others saw the potential of aircraft serving as an extension of the might and range of a naval force at sea. They were convinced that airplanes wouldn’t be used just for circus sideshows and crop-dusting. They believed aircraft would transport troops across oceans and be equipped to strike offensively.

The Navy was again looking upward. As the Assistant Secretary of the Navy, Theodore Roosevelt recommended that the Secretary of the Navy appoint two officers “…of scientific attainments and practical ability…” to examine Professor Samuel P. Langley’s flying machine and report on its potential for military use.

One such man was Navy Captain Washington Irving Chambers, the U.S. Navy’s first officer in charge of aviation. Captain Chambers’ initial involvement was to answer letters from air-minded citizens and observe and report on aviation developments of particular concern to the Navy. What started as a collateral duty soon was a full-time job, and Chambers became a strong supporter of those who wanted to see the sea service add an air arm.

In April 1911, the Office of Aviation in Washington, D.C., consisted of only Captain Chambers. In May, he wrote requisitions for two machines made of wood, canvas, bamboo, rubber, and metal—two airplanes, the A-1 and the A-2. Earlier in the year, a civilian, Eugene Ely, had successfully taken off from and later landed a biplane on a platform rigged aboard USS Pennsylvania (ACR 4), demonstrating the practical use of naval aircraft.

Shortly thereafter, the Navy accepted delivery of its first airplane, the A-1. The A-1 was first flown by Lieutenant T. G. Ellyson, the Navy’s first aviator. The A-1 was followed by the A-2; naval aviation had gotten off the ground.

By October 1911, the Navy was ready to try durability flights. Lieutenants Ellyson and J. H. Towers attempted a flight from Annapolis to Fort Monroe, Virginia. After flying 112 miles in 122 minutes, the pair was forced down somewhat short of their goal by mechanical problems. Although a failure in part, the flight paved the way for successful durability tests in the following months.

Based on tremendous headway made in a few short years, in 1914, Secretary of the Navy Josephus Daniels prophesied “…the science of aerial navigation has reached that point where aircraft must form a large part of our naval force for offensive and defensive operations.” It had become evident that the airplane was no longer merely a plaything of the rich or eccentric—it had become a vital part of our nation’s weaponry.

OTHER DEVELOPMENTS FROM 1900 THROUGH WWI

Meanwhile, the Navy was switching from coal to oil as fuel for its ships. USS Nevada (BB 36) was the first of the battleships to use oil. The day of the coal passer was on the way out.
Navy involvement in exploration continued during the first decade of the century. On April 6, 1909, Commander Robert E. Peary, accompanied by Matthew Henson, reached the North Pole.

In pre-World War I days, the Navy also carried out its role as a diplomatic arm of the government. On December 16, 1907, the Great White Fleet left Hampton Roads, Virginia, for a round-the-world cruise to show the flag. The exercise demonstrated the strength of the U.S. Navy.

Although the United States entered World War I late, the Navy had plenty of time to make history. On May 4, 1917, six American destroyers commanded by Commander Joseph K. Taussig steamed into Queenstown, Ireland. They became the first U.S. Navy ships to operate in European waters during World War I. The event, billed as the “return of the Mayflower,” was a great morale booster and aid for the Allied forces. The incident is probably best remembered by Commander Taussig’s simple remark upon reporting to the British admiral in charge: “I shall be ready when refueled, sir.”

Destroyers became a primary symbol of British-American cooperation during WWI. Destroyers were the main defense against German U-boats, which were practicing unrestricted warfare and terrorizing the seas. U-boat attacks were one reason for our entry into the war.

The British and Americans exchanged signals, codes, and inventions in combining their destroyer forces to seek out and attack the German submarines. Destroyers served as escorts for troopships and supply convoys for the Allies, helping to ensure their safety. On November 17, 1917, the destroyers USS Nicholson and USS Fanning were the first U.S. ships to sink an enemy submarine.

When the United States entered World War I, naval aviation assets were limited. The nation had only 54 aircraft, 1 air station, and 287 personnel assigned to aviation. The nation had no armed forces or operations abroad.

In spite of its size, the air arm proved its value as a supporting unit to surface antisubmarine (ASW) forces. Navy pilots served with Allied units in France and England. The airplane created a new breed of hero, the ace. Nineteen year-old Lieutenant David Ingalls, later Assistant Secretary of the Navy (Air), flew a Sopwith Camel to become the Navy’s first ace.

In World War I, the women’s role in the Navy came into its own. In 1811, a Navy surgeon recommended employing women in hospitals to care for the Navy’s sick and wounded. The idea was not acted upon at that time.

**NOTE**

In the Civil War, women nurses, although not part of the Navy, served aboard the hospital ship USS Red Rover in the medical department. In the war of 1898, the first trained nurses in the Navy, though not an official unit, were stationed at the Norfolk Naval Hospital to care for the injured. A decade later (in 1908), the Nurse Corps was officially born.

As the nation readied itself for World War I, it needed Yeomen and personnel in related jobs to handle the growing demand from headquarters and naval shore stations. Josephus Daniels, Secretary of the Navy, asked his legal advisors, “Is there any law that says a Yeoman must be a man?” The answer was no, but until that time only men had been enlisted. “Then enroll women in the Naval Reserve as Yeomen,” the Secretary said. In such jobs, he added, they would offer the best “assistance that the country can provide.”

Immediately after the United States entered World War I, women were enlisted on a large scale “in order to release enlisted men for active service at sea.” By the time the armistice was signed, 11,275 women were enlisted in service as Yeomen (F). They handled most of the clerical work at the Navy Department, in addition to many highly important special duties. Yeomen (F) were stationed in Guam, the Panama Canal Zone, and Hawaii, in addition to the United States and France. About 300 “Marinettes,” as the female enlisted personnel of the Marine Corps were designated, were on duty during the war. Most of them were stationed at Marine Corps Headquarters at the Navy Department, although a number were assigned with Marine Corps recruiting units.

All Yeomen (F) were released from active duty by July 31, 1919. Secretary Daniels sent the following message to the Yeomen (F): “It is with deep gratitude for the splendid service rendered by the Yeomen (F) during our national emergency that I convey to them the sincere appreciation of the Navy Department for their patriotic cooperation.”

**Student Notes:**
REVIEW 4 QUESTIONS

All questions in this review concern WWI.

Q1. Before WW I, the Navy built surface ships and submarines. What other development occurred then that is still a big part of today’s naval arsenal?

Q2. What was one reason why the U.S. Navy was deployed?

Q3. Describe the role of Navy destroyers.

Q4. Describe the role of the air forces.

Q5. What was the role of Navy women?

THE NAVY FROM 1920 TO 1950

Learning Objective: When you finish this chapter, you will be able to—

• Recognize the roles and responsibilities of the Navy from 1920 through 1950 to include World War II and the post-war years.

The world was changing rapidly from the end of WWI to 1950. During the 1920s, the world economy boomed, then fell. In the 1930s, there was the “Great Depression.” In 1939, World War II began. In this section, you will learn about some of the developments made by the U.S. Navy.

1920 TO 1940

Between 1920 and 1940, the U.S. Navy was developing its aviation arm to include aircraft carriers and airships and airplanes. Also, it was building up its destroyer strength.

Aviation

Great strides in aviation had been made during World War I, and the end of the war did not slow the pace of progress. On May 8, 1919, three Navy Curtiss (NC) flying boats taxied into the bay of Far Rockaway, New York, and took off for Europe. Plagued by mechanical difficulties, two NCs failed to make it. The NC-4, piloted by Lieutenant Commander Albert C. Read, became the first airplane to fly the Atlantic. LCDR Read’s message from Lisbon, Portugal, to the President read, “We are safely across the pond. The job is finished.” The NC-4 is now located at the National Museum of Naval Aviation, Pensacola, Florida.

With transoceanic aircraft a reality, the Navy continued to research the use of rigid airships in its air arm. In 1923, Shenandoah was launched. During a severe squall in 1925, the Shenandoah broke in half and killed 14 men. At that time, some authorities questioned the safety of the airship since it was fueled with highly flammable hydrogen. In spite of some opposition, the Navy continued to test rigid airships throughout the next decade. In 1931, USS Akron was launched. The Akron crashed in 1933 during a thunderstorm, killing the entire crew.

In November 1929 a Ford trimotor aircraft, named the Floyd Bennett, carried Commander Richard E. Byrd and his crew on the first flight over the South Pole. Commander Byrd thereby became the first man to fly over both poles.

In 1933, Macon was commissioned. Two years later the Macon also crashed into the sea. The Navy then abandoned research and construction of rigid airships.

Aircraft Carriers

In 1934, the USS Ranger, the first carrier designed from the keel up, joined the fleet. Also in the 1930s and prewar 1940s, the large aircraft carriers USS Enterprise, USS Wasp, USS Hornet, and USS Yorktown were commissioned.
